2      -e ansible_python_interpreter=/home/user/ansible-env/bin/
3  python \
4      -M /home/user/ansible-env/lib/python3.8/site-packages/ \

Contributing

1. See general guidelines: https://docs.ansible.com/ansible/latest/dev_guide/developing_modules_general.html
2. Install `pre-commit` and `tox`

```
1  pip install tox pre-
2  commit
   pre-commit install
```

1. When new module is implemented, don't forget to update `py_modules` section in `setup.py` file.
2. When new module is implemented, it should be covered with tests. Run tests using `tox`

1. Module name should consist of three parts separated by underscore: `waldur`, plugin name, entity name. For example, `waldur_os_snapshot` refers to OpenStack (OS) as plugin name and snapshot as entity name.
