Introduction

It is possible to import into a Waldur offerings from a remote Waldur.

Pre-requisites

- An organization in the remote Waldur, which will contain requests and projects from the local Waldur.
- Account with owner role that will be used for integration.
- Access to APIs of remote Waldur.

High level process

- In local Waldur, make sure that you have a service provider organization available.
- Click on "Import offering".
- Input remote Waldur API and authentication token.
- Select the remote organization and offering to be imported.
- Review and activate the offering.

EduTeams account SYNC

In case both local and remote Waldurs are relying on a common set of identities from EduTeams, it is possible to configure synchronisation of the identities as well, i.e. when a resource is provisioned in a remote Waldur, local accounts from organization and project are pushed and mapped to the remote project.

> **Note**
>
> For this to work, remote Waldur must be integrated with eduTeams registry and integration user must have `identity_manager` role.
